

# HTTP

---

Tuesday, October 17, 2017 7:20 AM

## How it works:

1. Request or response line
2. Header section
3. Entity body

You can start webgoat  
cd Documents  
java -jar webgoat... -httpPort 8081

The client contacts the server and sends a document request

GET /index.html?param=value HTTP/1.0

Next, the client sends optional header information to inform the server of its configuration and document formats it will accept:

User-Agent: Mozilla/4.06 Accept: image/gif, image/jpeg, \*/\*

Afterwards, the client may send additional data to be used by CGI programs using the POST method
